NEW PRODUCT RELEASE

Ideal Syringe Pump for Injecting Radioactive Labeled Chemicals

When pumping radioactive chemicals where a Beta or Gamma shield must be present, the **KD Scientific Model KDS 310 Syringe Pump** is ideal because of its remote pumping unit and control box.

The control box can be located up to 6 feet away which permits it to be located behind a radioactive shield providing protection to the operator while delivering the injection.

The **KDS 310 Nano Pump** is used exclusively with micro syringes in sizes from 0.5 to 250 μ l. Small size, remote control and a rugged mounting arm make it ideal for use with micromanipulators, stereotaxic frames and other clamping devices. When used on a stereotaxic frame direct injection can be performed thus reducing the volume of sample required.

The microprocessor based controller uses a bright display and membrane keypad with a simple, menu-prompt system for easy setup. The pump features preset rate and volume control. The dispense volume is displayed continuously and the pump shuts off automatically when the preset volume has been reached.

KD Scientific designs, manufactures and sells a range of quality fluidics equipment used by research laboratory markets worldwide.
